-  Hack The Box (briancgx)

SUMMARY

Offensive security specialist and Red Teamer with hands-on experience in technical audits, adversary simulations, and penetration testing across Fintech, airlines, web platforms, and cloud environments. I have worked in real-world black-box and gray-box scenarios, developing advanced skills in WAF evasion, bypassing defensive mechanisms, and application exploitation. My experience includes assessments of critical infrastructure and environments regulated by financial authorities. Formerly ranked first in the Hack The Box Mexico national leaderboard, and finalist in competitions such as HackMex and HackDef. I led the Cybersecurity Division at AAAIMX and now lead AHAU Yucatán, a local community focused on technical initiatives and cybersecurity training. I also maintain an active research line with publications indexed in Scopus and the Journal of Artificial Intelligence and Computing Applications.

EDUCATION

2022 - 2026	B.S. in Computer Systems Engineering Broad academic training in computer science fundamentals, including programming, networks, databases, and operating systems. Additionally, I have specialized in offensive cybersecurity and artificial intelligence, focusing on penetration testing, vulnerability analysis, supervised classification (Random Forest), and computer vision using models such as YOLO.	Instituto Tecnológico de Mérida
-------------	---	--

EXPERIENCE

10/2025 - 07/2026	AI Security Researcher	Straiker AI
- Led red team squads across adversarial campaigns, coordinating offensive operations against AI-integrated environments. - Ran offensive assessments against AI systems (generative models, inference APIs), uncovering critical vulnerabilities via direct/indirect prompt injection, insecure output handling, and plugin abuse. - Built adversarial red-team exercises (MCP) emulating supply-chain attacks, training-data poisoning, and model theft to stress-test LLM-integrated environments. - Demonstrated risks of excessive LLM agency, autonomy, and permissions, driving concrete improvements to internal AI security policies. Red Teaming / AI Model Exploitation / Prompt Injection / Training Data Poisoning / Plugin Abuse / WAF Evasion / LLM Risk Assessment / Technical Documentation		
02/2025 - 02/2026	Red Team Operator	DIRECCIÓN Y CONTROL DE FRANQUICIAS, S.A. DE C.V.
- Led penetration tests on web apps, APIs, and cloud environments across fintech, airlines, financial regulators, e-commerce, and government, evading WAFs and exploiting critical vulnerabilities. - Compromised production-critical platforms, including financial systems and institutional portals, through post-exploitation, privilege escalation, and lateral movement across Windows and Linux. - Designed and executed targeted spear-phishing campaigns against multiple organizations, consistently compromising employee accounts through social engineering. - Executed Active Directory attack chains, escalating from initial foothold to full domain compromise across enterprise environments. - Developed offensive automation (Python, Bash, PowerShell) for reconnaissance, exploitation, and evidence extraction, contributing to a 36% increase in vulnerability identification. - Delivered technical reports and executive-level findings to CISOs and high-level stakeholders. Red Teaming / Web Pentesting / WAF Evasion / Privilege Escalation / Lateral Movement / Documentation		

ACHIEVEMENTS AND COMPETITIONS

2024 & 2025	Finalist at HackMex and HackDef	Mexico
Participated in national cybersecurity competitions, achieving top placements and demonstrating advanced skills in vulnerability analysis and red teaming. Vulnerability Assessment / Exploitation / Reversing / Malware Analysis / Web Hacking / OSINT / Crypto		
09/2024 - 09/2025	Chair - ACM Student Chapter, IT Mérida	Association for Computing Machinery, Mexico
- Organized events, technical talks, and promoted academic engagement in science and technology fields. - Facilitated training and networking opportunities for students interested in engineering and cybersecurity. - Led strategic planning and outreach efforts to expand chapter visibility at the national level. Leadership / Technical Outreach		
02/2024 - 05/2025	Cybersecurity Division Lead	AAAIMX International Student Chapter, Mexico
- Led cybersecurity projects and mentored members in offensive security topics. - Promoted best practices and organized technical workshops within the AAAIMX community. Leadership / Mentorship / Cybersecurity		
09/2023	Intelligent Behavior Competition	Complutense University of Madrid
Ranked fourth in an AI competition applying machine learning to analyze complex behavior patterns. Artificial Intelligence / Machine Learning		

CERTIFICATIONS

04/2026	C-AgAIPen - Certified Agentic AI Pentester	The SecOps Group
01/2026	CPTS - Certified Penetration Testing Specialist	Hack The Box
12/2025	BSCP - Burp Suite Certified Practitioner	PortSwigger
11/2025	C-AI/MLPen - Certified AI/ML Pentester	The SecOps Group
11/2025	CRTeamer - Certified Red Teamer	The SecOps Group
04/2025	eWPTX - Web Application Penetration Tester eXtreme	INE Security
Hack The Box Pro Labs		
Dante - Red Team Operator L1 / FullHouse - Red Team Operator L1 / P00 - Red Team Operator L1		
Hack The Box		

PUBLICATIONS

5/2024	Counterfactual Explanation of a Classification Model for Detecting SQL Injection Attacks	ICCBR
Research paper presented at the International Conference on Case-Based Reasoning (ICCBR 2024) and published in CEUR-WS, indexed by SCOPUS and Google Scholar. The study proposes a classification model to detect SQL injection attacks, incorporating counterfactual explanations to enhance interpretability. The system was developed using Python and machine learning techniques, demonstrating practical applicability in database security and the use of XAI for transparent decision-making.		
SQL Injection / Python / Explainable Artificial Intelligence (XAI)		

Scientific article published in the Journal of Artificial Intelligence and Computing Applications. The study introduces a computer vision-based system for the automated identification of *Triatoma infestans*, the main vector of Chagas disease. The model, trained with 91 annotated images and 9,100 augmented samples, achieved a mAP@50 of 0.9588, showing high precision even under varied lighting and background conditions. This research contributes to entomological surveillance through AI-powered solutions suitable for mobile and embedded systems.

Computer Vision / YOLOv8 / Deep Learning / Entomological Surveillance
